<b>DB Manager</b>	DB Manager is a database management application that allows users to manage MySQL databases for their website.	90 day sunset to begin upon partner release of platform and Online Presence Builder	MySQL Manager  Users can use MySQL Manager to create and manage MySQL databases and users.	To manage new or existing MySQL databases, users can access MySQL Manager through "Advanced Tools" in their Portal.
<b>Easy Blog Builder</b>	Easy Blog Builder is an outdated application that allowed users to create and manage a blog for their website.	90 day sunset to begin upon partner release of platform and Online Presence Builder	Third-party Tool  Users can use WordPress or another third-party tool to create and add a blog to their website.	We recommend using this opportunity to redesign your website using Online Presence Builder - our new site design tool that uses the latest technology and automatically optimizes your website to display properly across desktop, tablet and mobile devices.  These instructions use WordPress as an example third-party application.  Depending on your package, some users will have access to <i>WordPress Installer</i> , an application found within "Advanced Tools" in Portal. Simply launch <i>WordPress Installer</i> , and follow the wizard to install WordPress for your Online Presence Builder website.  Some users may have to manually install third-party applications, such as WordPress. To manually install WordPress follow these instructions. The instructions will be very similar for installing other third-party applications.  1. Begin by downloading the WordPress app package to your computer ( <a href="http://wordpress.org/download/">http://wordpress.org/download/</a> ). 2. Upload the WordPress app package to your hosting account using FTP or <i>File Manager Pro</i> . <ul style="list-style-type: none"> <li>To use <i>File Manager Pro</i>, launch <i>File Manager Pro</i>, found in <i>Advanced Tools</i>.</li> <li>Click to open the folder to which you'd like to upload files (public.html). Create a new folder to upload and/or extract your WordPress files. The folder name you use will be used as the URL for your blog or webpage.</li> <li>Click Upload from the top toolbar.</li> <li>Click Browse (some web browsers will have Choose File instead).</li> <li>Select the file on your computer that you wish to upload.</li> </ul> 3. Most blog applications including WordPress store data in a database, so you will need to create a database using <i>MySQL Manager</i> , and make note of the database name, username and password. <ul style="list-style-type: none"> <li>Access <i>MySQL Manager</i> through <i>Advanced Tools</i>.</li> <li>If you haven't created any users, you will first need to create a user.</li> <li>Select the user you would like to use to create the database, and login.</li> <li>Select: CREATE &gt; DATABASE, and enter a name for your database (e.g., wordpress).</li> </ul>

- Select “Build Query” > “Run Query”.
- You should now see your new database in your list of databases.

4. Next you will need to configure the installation file for WordPress: `wp-config-sample.php`.

- In the *Advanced Tools* section, click the *File Manager Pro* icon.
- Click **public\_html** to expand the folder.
- Click the folder containing the Wordpress. If the folder is zipped, click “Extract” to extract the files, and then select the extracted folder.
- Locate the `wp-config-sample.php` file, and right click on the file, select **Rename** and change the name of the file to `wp-config.php`. Click the **Rename File** button.
- Right-click on the `wp-config.php` file and select **Edit as Text**. When the file opens, look for the following information:
  - `define('DB_NAME', 'database_name_here');`

```
/** MySQL database username */
define('DB_USER',
'username_here');
```

```
/** MySQL database password */
define('DB_PASSWORD',
'password_here');
```

```
/** MySQL hostname */
define('DB_HOST', 'localhost');
```

- Replace `database_name_here` with the name of the database you created (above in Step 3).
- Replace `username_here` with the username of the database you created.
- Replace `password_here` with the password of the database that you created.
- Replace `localhost` with the DB Host of the database that you created (you can find this in *MySQL Manager* under the DB Host column).

- When done editing, click the **Save** button, then close the file.

5. Open a new browser window and go to the installation page to run the installation script. Depending on where you installed the script, you will find it at either of the following URLs:

`http://yourdomain.com/wp-admin/install.php`

`http://yourdomain.com/blog/wp-admin/install.php`

Replace “blog” with the name of the folder where you uploaded and/or extracted your WordPress files in *File Manager Pro*.

Be sure to replace *yourdomain.com* in the example above with your actual domain name.

You should now see a WordPress installation wizard, beginning with a prompt to select your language, followed by “Welcome to the famous five-minute WordPress installation process!”

6. Complete the Installation

Click **Install Now**, and you should be taken to the final screen, showing the following message: Success! WordPress has been installed. You can now log in and manage your WordPress webpage. Your WordPress page will be live at <http://yourdomain.com/blog>, where “blog” is the folder where you uploaded and/or extracted your WordPress files in *File Manager Pro*.

We recommend using this opportunity to redesign your website using Online Presence Builder - our new site design tool that uses the latest technology and automatically optimizes your website to display properly across desktop, tablet and mobile devices.
